

GitHub API ETL Project

- **Overview:** The development of an ETL pipeline using GitHub's API to extract repository data, transform it for analysis, and load it into a database.
- **Key Contributions:** Extracted repository details like name, description, stars, forks, and contributors from GitHub's API. Transformed raw JSON responses into a structured format for analysis and visualization. Designed and implemented a SQL database schema for efficient storage and retrieval of repository data.
- **Impact:** Empowered stakeholders with insights into trending repositories and technology adoption trends, aiding decision-making in software development.
